Gravimetric analysis, in short, involves changing one compound containing the constituent into another compound containing that constituent and measuring the percent chloride in the new compound to determine the percent chloride in the previous compound. In this experiment, silver chloride will be produced from an unknown chloride compound.

Gravimetric Determination of Chloride Introduction The chloride content of a soluble salt, or of an aqueous solution, can be determined by precipitation of the chloride ion as silver chloride: $\text{Ag}^+(\text{aq}) + \text{Cl}^-(\text{aq}) \rightarrow \text{AgCl}(\text{s})$ The silver chloride precipitate initially forms as a colloid, which is coagulated with heat.

Gravimetric Determination of Chloride

Gravimetric analysis will be performed to identify an unknown chloride salt. This method of analysis allows for a quantitative determination of the mass percent of chlorine in the unknown through precipitation of the chloride ions in the form of silver chloride.

Identifying an unknown chloride salt by gravimetric analysis

Gravimetric analysis involve a weighing as the determining measurement, wheres volumetric analysis involve a volume measurement as the determining measurement. what does stoichiometry mean? Stoichiometry is the mole ratio of atoms in a compound or compounds in a chemical reaction and refers to the amounts of substances involved in reactions.

Gravimetric Analysis of a Chloride Salt Flashcards | Quizlet

The second method will use gravimetric analysis to determine chloride content. The results from both methods were very similar have average mass percent's of 28.34% and 26.79%. This seems to indicate that the content in chloride found was correct despite the fact that the actual content is not known.

Determination of Chloride Content in an Unknown Salt

Gravimetric analysis is a quantitative method for accurately determining the amount of a substance by selective precipitation of the substance from an aqueous solution. The precipitate is separated from the remaining aqueous solution by filtration and is then weighed. Assuming that the chemical formula for the precipitate is known and that the precipitation reaction goes all the way to completion, then the mass of the substance in the original sample can be determined.

Gravimetric method is by the quantitative determination of the mass of anhydrous Barium Sulphate precipitate. Barium sulphate precipitate is form when Barium Chloride is added excessively to a hot given Sulphate solution slightly acidified with concentrated Hydrochloride acid.

Gravimetric Analysis report , Sample of Reports

The mass of the sample was multiplied by the percentage concentration of the chloride then divided by 35.5. The result was then divided by 0.1. The result was converted into ml. 5 ml of excess was then added to the result, making the final result and approximate volume of silver nitrate added, 23ml.

Gravimetric Analysis of a Chloride Salt - UKEssays.com

An example of a gravimetric analysis is the determination of chloride in a compound. In order to do a gravimetric analysis, a cation must be found that forms an insoluble compound with chloride. This compound must also be pure and easily filtered. The solubility rules indicate that Ag^+ , Pb^{2+} , and Hg^{2+} form insoluble chlorides.
