Figure $\{\text{PageIndex}\{2\}\}$ shows values of IE versus position on the periodic table. Again, the trend is not absolute, but the general trends going across and down the periodic table should be obvious. Figure $\{\text{PageIndex}\{2\}\}$: Ionization Energy on the Periodic Table. Values are in kJ/mol. IE also shows an interesting trend within a given atom.

Periodic Trend. The atomic radius of atoms generally decreases from left to right across a period. There are some small exceptions, such as the oxygen radius being slightly greater than the nitrogen radius. Within a period, protons are added to the nucleus as electrons are being added to the same principal energy level.

Figure $\{\text{PageIndex}\{3\}\}$: A Plot of Periodic Variation of Atomic Radius with Atomic Number for the First Six Rows of the Periodic Table. In the periodic table, atomic radii decrease from left to right across a row and increase from top to bottom down a column. Because of these two trends, the largest atoms are found in the lower left corner of ...

8.6: Periodic Trends in the Size of Atoms and Effective ...

Ionization energy is the energy required to remove an electron from a specific atom. It is measured in kJ/mol, which is an energy unit, much like calories. The ionization energies associated with some elements are described in the Table 1. For any given atom, the outermost valence electrons will have lower ionization energies than the inner-shell kernel electrons.

Lithium-ion suffers from stress when exposed to heat, so does keeping a cell at a high charge voltage. A battery dwelling above 30°C (86°F) is considered elevated temperature and for most Li-ion a voltage above 4.10V/cell is deemed as high voltage. Exposing the battery to high temperature and dwelling in a full state-of-charge for an extended time can be more stressful than cycling.

The importance of pKas in organic chemistry can't be overestimated, in my opinion. Not knowing pKa's in organic chemistry is like not knowing the value of the hands in poker. In this scheme, alkyl anions are the equivalent of the royal flush - they win the proton from everything underneath them in the table.
